

Technical Assessment

Finance AI Automation Developer

Assessment Overview

Thank you for your interest in the Finance AI Automation Developer position. This technical assessment is intended to evaluate practical software engineering, AI-assisted development capability, architectural judgment, and governance awareness.

Use of AI-assisted development tools (such as ChatGPT, GitHub Copilot, OpenAI APIs, or similar technologies) is expected and encouraged as part of this assessment.

Assessment Objective

You are expected to design and implement a practical AI-assisted automation solution aligned with Finance, audit, and governance workflows. The solution does not need to be production-complete. We are more interested in engineering judgment, maintainability, AI usage approach, and architectural thinking than feature quantity.

Choose ONE Scenario

Option 1 — Local Unit Audit Support Automation

Build an AI-assisted application supporting local unit audit processes. Your solution may help organize evidence, identify missing documentation, summarize findings, or assist with audit traceability and review workflows.

Illustrative examples (examples only):

- Identify reimbursement transactions missing receipts or approvals.
- Detect unusually large or potentially duplicate reimbursements for additional review.
- Generate draft audit comments or summaries from uploaded evidence.

Option 2 — Internal Controls Evaluation Assistant

Build an AI-assisted solution supporting evaluation of operational or financial controls. Your application may analyze process descriptions, identify control gaps, recommend improvements, or surface automation opportunities.

Illustrative examples (examples only):

- Identify segregation-of-duties concerns within a process workflow.
- Detect missing preventive or detective controls in process descriptions.
- Identify repetitive spreadsheet-based workflows and suggest automation opportunities.

Expected Solution Characteristics

- AI-assisted functionality

- Clear workflow design
- Human-in-the-loop validation
- Auditability and logging
- Maintainable code structure
- Error handling and validation
- Reasonable security and governance considerations

Security and Governance Awareness

You are expected to demonstrate basic security and governance awareness appropriate for Finance and audit-related workflows. This is not intended to be a dedicated security engineering assessment.

- Input validation
- Basic access control awareness
- Protection of sensitive information
- Audit logging
- Responsible handling of AI-generated outputs
- Human review for high-impact actions

Technology Guidance

You may choose your preferred technology stack. Preferred technologies include Python, C#/.NET, Java, Power Platform, Copilot Studio, OpenAI APIs, Azure OpenAI, or similar technologies.

Required Deliverables

- Working application or prototype
- Source code repository or ZIP file
- README with setup and execution instructions
- Short architecture/design summary
- AI usage report describing tools, prompts, and validation approach

AI Usage Transparency

Please document how AI tools were used during development, including example prompts, areas where generated code was modified, and how outputs were validated. The purpose is not to avoid AI usage, but to evaluate effective and responsible use of AI-assisted development.

Evaluation Criteria

Category	What We Evaluate
Functionality	Practical completeness and workflow execution

Code Quality	Maintainability, structure, readability
AI Integration	Appropriate and validated use of AI
Governance	Human review, traceability, auditability
Engineering Practices	Testing, logging, error handling
Communication	Documentation and architectural explanation

Technical Interview

Selected candidates will participate in a follow-up technical interview discussing architecture decisions, implementation details, AI governance considerations, and potential live modifications to the solution.

Submission Expectations

Please focus on clarity, maintainability, and thoughtful implementation decisions. You are encouraged to document assumptions, tradeoffs, and prioritization decisions where appropriate.

We appreciate your time and effort and look forward to reviewing your solution.
